

I oppose changing Part 15.231(e) to support RFID systems as recommended. I believe that the systems are likely to cause significant interference to weak signal amateur operations in the 70cm band. The mobile nature of such systems would make remediation attempts very difficult. There is no basis in fact in SAVI's statement that the systems would be used in commercial areas where there are few amateur operations. On the contrary there are very likely to be amateur operations near such commercial areas. I know of at least two in my city.
